

Forklift Fork Positioner

Forklift Fork Positioner - A fork positioner is actually a tool made out of high quality materials intended to withstand the most challenging operations and work environments. This piece of equipment could enable the one driving to be able to maneuver the forks hydraulically without leaving the seat. Side shifting units have the added ability to be able to laterally position the entire load or the arms in order to facilitate more accurate lifting and placement in a faster and much more efficient manner.

The fork pocket is somewhat unique and enables the person operating it to securely swing the blades into position without any fear of destroying the positioning cylinders. This allows the operator the alternative to be able to execute independent or simultaneous fork movement, dependent upon the requirements of the job. For most lift trucks with non-OEM carriages, complete carriages are necessary. Standard OEM carriages can be transformed into blade positioners on available units.
